

Day 10:

1. xml basics

introduction , well formed, valid xml

xml processing : dom , sax

JAXB

tools required:

axis2

soapui

postman

link provided..

2. Introduction to SOA, distributed computing

basics of JAX-WS

apache axis2

examples and applications

basics of REST web service

jersey hello world, crud application

what is xml?

the process of BL bw two or more machines / server

- ✓ => RMI (remote method invocation)
- ✓ => EJB (enterprise java bean)
- ✓ => Web service
- ✓ => remoting

web application and web service

RMI will work :)

data need to be converted to object
serilized data => java tech
de-serilization some kind io process

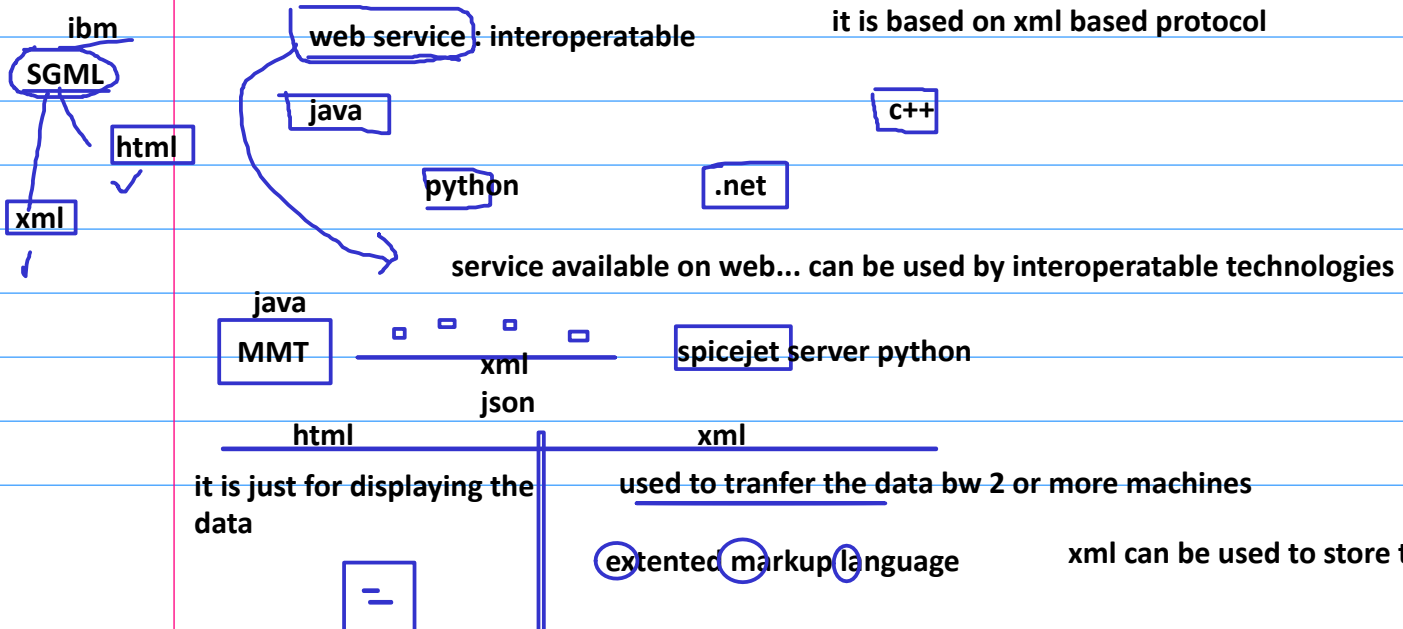

it works only if two parties are java based

When RMI will not work :(

RMI is not interoperatable

EJB is also based on RMI => same issue it is not "interoperatable"

What next?

xml : how to write xml, validate the xml, well formness

how to process the xml

JAXB

12

BTech

parser? and check well formness of xml

1. well formness of xml
 2. xml should be valid
- DTD
Schema (more powerful than dtd)

Schema: is a tech for validation of xml
it is more powerful than dtd

w3c org

maintain the draft of many tech

1. it support rich data type
2. it also support namespace concept

hello world of schema file

data type

schema

int double date

...

```
<?xml version="1.0" encoding="UTF-8"?>
<schema xmlns="http://www.w3.org/2001/XMLSchema"
  targetNamespace="http://www.ivy.com/employees"
  xmlns:tns="http://www.ivy.com/employees" elementFormDefault="qualified">

  <element name="employees" type="tns:employeesType"></element>

  <complexType name="employeesType">
    <sequence>
      <element name="companyName" type="string" maxOccurs="1"
        minOccurs="1">
      </element>
      <element name="employee" type="tns:employeeType" maxOccurs="unbounded" minOccurs="0"></element>
    </sequence>
  </complexType>

  <complexType name="employeeType">
    <sequence>
      <element name="id" type="int"></element>
      <element name="name" type="string"></element>
      <element name="address" type="string"></element>
      <element name="dob" type="date"></element>
    </sequence>
  </complexType>
</schema>
```

XML processing:

DOM: doc object model, curd operation
continous stream of data u must have all the data in memory..

this server should
process xml

Event based model SAX: Simple API for XML processing, this can be used only for reading purpose
JAXB

//Creating elements

```
Element rootEle=document.createElement("students");
Element studentEle=document.createElement("student");
Element nameEle=document.createElement("name");
Element emailEle=document.createElement("email");
Element mobileEle=document.createElement("mobile");
Element addressEle=document.createElement("address");
//Creating text infomration to store
Text t1=document.createTextNode("raja");
Text t2=document.createTextNode("raja@raja.com");
Text t3=document.createTextNode("434343434");
Text t4=document.createTextNode("noida");
```

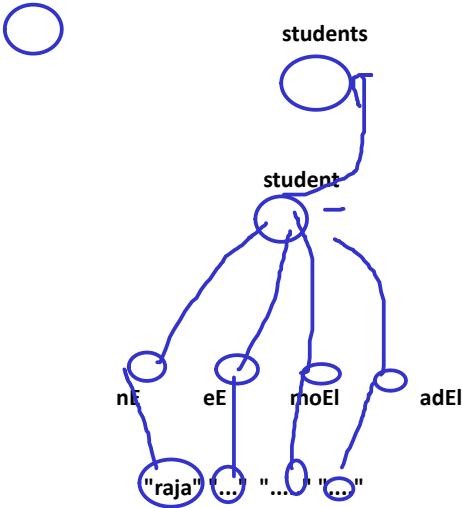

```
nameEle.appendChild(t1);
emailEle.appendChild(t1);
mobileEle.appendChild(t1);
addressEle.appendChild(t1);

studentEle.appendChild(nameEle);
studentEle.appendChild(emailEle);
studentEle.appendChild(mobileEle);
studentEle.appendChild(addressEle);
```

```
rootEle.appendChild(studentEle);
document.appendChild(rootEle);
Transformer t=TransformerFactory.newInstance().newTransformer();

t.transform(new DOMSource(document), new StreamResult(new FileOutputStream("students.xml")));

System.out.println("xml file generated...");
```

Event handling: ui app
swing , js form validation

what it do?
is used to convert xml -> java

java --> xml

ORM: hib

it is a high level api and easy to use and work with annotation

interoperability?

web service

DOM

crud op all data should be present

SAX

Event based processing

DTD vs Schema

JAXB: very similar to ORM

web service

XML <-----> Java

ws is of 2 type

SOAP based ws

REST based ws

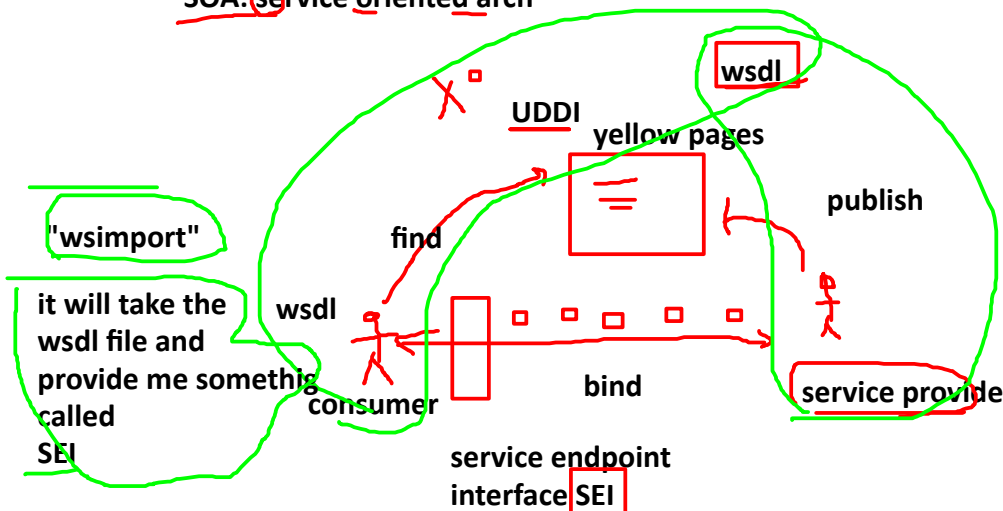

Web service : is a piece of code (logic) that run on remote machine and can be invoked using xml protocol

WSDL: Web service description language (similar to java interface : contract bw 2 parties)

UDDI: Universal description discovery and integration (registry)

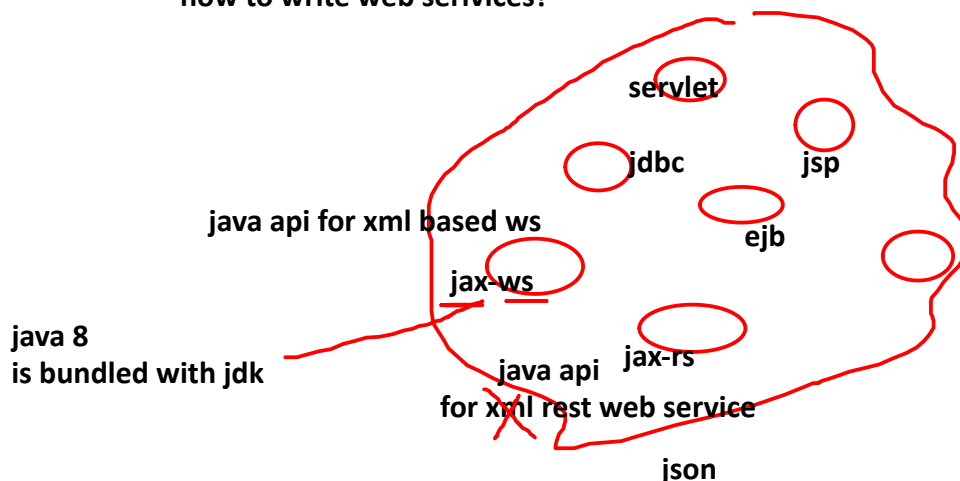

SOAP: simple object access protocol

SOA: Service oriented arch

how to write web services?

J2EE

jax-ws

apache cfx

apache axis2

hello world of soap web service
step?

what is good prg practice

contract --> code

dao-> daoImpl

first u write the wsdl
and then show to ur higher
manamgement
once is is ok
then u are allowed to
change it no matter what...

code-> contract

code first approach (easy)
not very good :)

if u change ur code => ur wsdl
is going to change
then client will cry :(

even if code is changing u should not change ur code

:(how to write wsdl file with hand

ie way people use mixed approached

u first get basics wsdl by running hello world and then u customised using anntation

```
<soapenv:Envelope xmlns:soapenv="http://schemas.xmlsoap.org/soap/envelope/" xmlns:com="http://com/">
  <soapenv:Header/>
  <soapenv:Body>
    <com:sum>
      <arg0>?</arg0>
      <arg1>?</arg1>
    </com:sum>
  </soapenv:Body>
</soapenv:Envelope>
```

```
<S:Envelope xmlns:S="http://schemas.xmlsoap.org/soap/envelope/">
  <S:Body>
    <ns2:sumResponse xmlns:ns2="http://com/">
      <return>3</return>
    </ns2:sumResponse>
  </S:Body>
</S:Envelope>
```

~~SOAP is based on xml~~

Full stack java dev

.net dev

MEAN

Spring with angular/react

how then soap is used in industry

in java we have many ways to create soap ws

1. hello world using Endpoint.publish (.....) only for learning
2. u can jax-ws-ri (ref implementation)
3. apache axis2 (open source framework for creating soap ws)
4. apache cxf (more powerful framework that can be used to create soap as well as rest service)
5. spring boot + soap

pls do practice on servlet jsp crud application

spring

hibernate

web service

practice make us perfect!

:)

Spring rest is not depend on jsr
